

EPHSA

ENVIRONMENTAL PROTECTION, HEALTH & SAFETY AGENCY

CORPORATE PROFILE & CAPABILITY STATEMENT

Integrated environmental, occupational health & compliance solutions
for heavy industry, maritime logistics & state-owned enterprises.

1. Executive Summary

EPHSA (Environmental Protection, Health and Safety Agency) is a specialised environmental, occupational health, and compliance consulting firm. Founded by a consortium of three industry experts, we provide end-to-end environmental risk management solutions for heavy industry, maritime logistics, and state-owned enterprises.

We bridge the gap between regulatory compliance and operational execution. By housing accredited training, baseline environmental monitoring, certified asbestos abatement, site rehabilitation, and final legal sign-off under one roof, EPHSA drastically reduces project turnaround times, eliminates the friction of managing multiple vendors, and ensures uncompromising adherence to national regulations.

We deliver this end-to-end capability either directly through our in-house technical team or through a trusted network of accredited partner companies and laboratories, ensuring clients receive comprehensive occupational health, safety, and environmental services without compromising on quality or turnaround time. All sampling and analysis conducted on our clients' behalf is carried out through SANAS-accredited laboratories, providing assurance that every result is defensible, audit-ready, and recognised by regulators.

2. Core Service Capabilities

Our combined capability spans the full environmental and occupational health lifecycle — from emissions and air quality monitoring, through carbon accounting and workforce training, to certified remediation and legal sign-off.

Quality Assurance. All sampling and analysis referenced throughout this document is conducted through SANAS-accredited laboratories, in accordance with ISO/IEC 17025 requirements — ensuring every result is defensible, audit-ready, and recognised by regulators.

Dust Fallout & Air Quality

Monitoring dust emissions from industrial activity to protect surrounding communities.

Air Emission Inventories

Quantifying point-source and fugitive emissions for licensing and NAEIS reporting.

GHG Emission Inventories

Scope 1, 2 & 3 carbon footprinting for tax, disclosure & reduction planning.

TVOC Sampling & Analysis

Measuring volatile organic compounds to protect worker & community health.

Asbestos Abatement & IBR Replacement

Compliant removal of legacy asbestos and installation of modern, asbestos-free roofing.

Water Quality Monitoring

Testing surface water, groundwater & effluent against national water quality standards.

Occupational Health Training

Accredited, site-specific training so your workforce can safely handle hazardous materials.

A. Dust Fallout & Air Quality Monitoring

Dust fallout monitoring is an environmental monitoring service used to measure the amount of dust and particulate matter that settles from the atmosphere onto the ground or surrounding surfaces. The purpose is to determine whether dust emissions from activities such as construction, material handling, and industrial operations are affecting the surrounding environment and nearby communities.

How the Monitoring Works. Monitoring is conducted using specially designed dust fallout buckets or collection units installed at strategic locations around the site. The units collect dust and other settling particles over a specified monitoring period, typically one month. The collected material is then retrieved and sent for laboratory analysis to determine the fallout rate and assess compliance with site-specific or national limits.

What the Client Receives

- Site assessment and identification of suitable monitoring locations.
- Installation and identification of dust fallout monitoring units.
- Routine inspection, maintenance, and monthly sample collection.
- SANAS-accredited laboratory analysis of collected samples.
- Interpretation of results and preparation of a professional monitoring report.
- Identification of potential exceedances and recommendations for dust-control measures.

Why It Is Important

- Demonstrates strict compliance with environmental legislation.
- Identifies potential sources and trends in dust emissions to proactively address complaints.
- Protects neighbouring communities and assesses the effectiveness of dust-suppression measures.
- Maintains reliable, audit-ready environmental records for regulatory reporting.

B. Asbestos Abatement & IBR Replacement

Managing legacy infrastructure requires strict adherence to the Asbestos Abatement Regulations. We manage the entire lifecycle of hazardous material removal, ensuring operations remain compliant and safe, while simultaneously upgrading the asset's structural integrity.

How the Abatement Works. The process begins with a comprehensive asbestos inventory and risk assessment by our technical specialists. A regulated safe-zone is established, and the legacy asbestos is carefully dismantled, sealed, and removed using legally mandated safety protocols. Once the site is cleared and decontaminated, we supply and install modern, asbestos-free alternative IBR (Inverted Box Rib) sheeting, followed by a final clearance inspection.

What the Client Receives

- Comprehensive site asbestos inventories and localised risk assessments.
- Department of Employment and Labour-compliant removal execution.
- Secure transportation and safe disposal certificates for all hazardous waste.
- Supply, delivery, and professional installation of durable IBR alternative sheeting.
- Final independent clearance certification and legal sign-off for the site.

Why It Is Important

- Ensures 100% compliance with the 2020 Asbestos Abatement Regulations.
- Eliminates long-term corporate liability and occupational health risks to employees.
- Upgrades aging infrastructure with modern, weather-resistant materials.
- Prevents operational shutdowns enforced by the Department of Labour.

C. Water Quality Monitoring

Water quality monitoring is a critical environmental service used to assess the physical, chemical, and biological characteristics of surface water, groundwater, and industrial effluent.

How the Monitoring Works. Our specialists identify strategic hydrological points across your operational footprint — such as discharge pipes, boreholes, and adjacent streams. We conduct scheduled sampling using sterile, regulated protocols. The samples are transported under strict chain-of-custody to accredited laboratories to test for heavy metals, pH levels, suspended solids, and chemical contaminants.

What the Client Receives

- Design and implementation of a custom water monitoring programme.
- Routine surface water, groundwater, and effluent sampling.
- SANAS-accredited laboratory testing and sample analysis.
- Detailed technical reporting comparing results against the National Water Act and municipal by-laws.
- Actionable consulting on contamination remediation and effluent management.

Why It Is Important

- Prevents illegal discharge penalties and protects the organisation's operating licence.
- Identifies early warning signs of infrastructure leaks or chemical run-off.
- Protects local ecosystems, groundwater reserves, and community health.
- Fulfils the stringent reporting requirements of the Department of Water and Sanitation.

D. Specialised Occupational Health Training

Compliance begins with workforce capability. We deliver accredited, site-specific training to ensure your personnel can safely operate in high-risk environments and manage hazardous materials effectively.

How the Training Works. EPHSA deploys certified facilitators directly to your site or hosts training in a controlled environment. Modules combine theoretical legislative frameworks with practical, on-the-ground safety protocols. Staff are assessed, and competence is formally recorded.

What the Client Receives

- Site-specific Asbestos Awareness and Safe Handling workshops.
- Comprehensive training manuals and safety protocol documentation.
- Formal assessments and issuance of Certificates of Competence for attendees.
- Consolidated training registers for HR and Health & Safety compliance audits.

Why It Is Important

- Fulfils the legal mandate requiring employers to inform and train staff on occupational hazards.
- Drastically reduces the risk of workplace incidents, exposure, and associated compensation claims.
- Empowers site managers and H&S officers to confidently manage day-to-day environmental risks.

E. Air Emission Inventories

Air emission inventories quantify the type and volume of pollutants released into the atmosphere from point sources — such as stacks, generators, and boilers — and fugitive sources across a site. They form the technical basis for atmospheric emission licensing and ongoing regulatory reporting.

How the Inventory Works. Our specialists conduct a site-wide source identification and characterisation exercise, mapping all point-source and fugitive emission points. Using approved emission factors, mass-balance calculations, and source testing where required, we compile a comprehensive facility-wide emissions inventory aligned with National Atmospheric Emission Inventory System (NAEIS) reporting requirements.

What the Client Receives

- Site-wide identification and mapping of point-source and fugitive emission sources.
- Calculation of pollutant loads using approved emission factors and methodologies.
- A comprehensive, audit-ready emissions inventory report.
- Support with NAEIS registration and annual submission.
- Recommendations for emission reduction and abatement technology.

Why It Is Important

- Mandatory for holders of an Atmospheric Emission Licence under the National Environmental Management: Air Quality Act.
- Provides the technical basis for licence applications, renewals, and compliance audits.
- Identifies the largest contributing sources so abatement spend is targeted effectively.
- Avoids penalties and reputational risk associated with non-reporting.

F. Greenhouse Gas Emission Inventories

Greenhouse gas (GHG) emission inventories quantify an organisation's Scope 1 (direct) and Scope 2 (energy-indirect) emissions, and where required Scope 3 (value chain) emissions, expressed as tonnes of CO₂-equivalent, in line with national carbon reporting obligations and international protocols.

How the Inventory Works. We collect activity data across fuel combustion, process emissions, electricity consumption, and fugitive sources, and apply approved emission factors under the GHG Protocol and the South African National GHG Inventory methodology to calculate a facility or corporate-level carbon footprint. The inventory is compiled into a format suitable for regulatory submission and voluntary disclosure.

What the Client Receives

- Data collection templates and activity-data verification.
- Scope 1, 2, and (where applicable) Scope 3 emissions calculations.
- A GHG inventory report aligned with the GHG Protocol and DFFE reporting requirements.
- Support with Carbon Tax Act and NAEIS/GHG reporting submissions.
- Baseline data to support emission-reduction target setting.

Why It Is Important

- Required for compliance with South Africa's mandatory GHG reporting regulations and Carbon Tax Act.
- Provides the data foundation for carbon tax liability calculations.
- Supports ESG disclosure, investor reporting, and sustainability commitments.
- Identifies the highest-impact areas for decarbonisation investment.

G. TVOC Sampling and Analysis

Total Volatile Organic Compound (TVOC) sampling measures the concentration of volatile organic compounds in ambient or workplace air, helping identify potential health risks to employees and surrounding communities from solvents, fuels, and other VOC-emitting processes.

How the Sampling Works. Our technicians deploy calibrated sampling equipment at strategic indoor, workplace, or perimeter locations, using active or passive sampling methods over a defined monitoring period. Samples are analysed by a SANAS-accredited laboratory using gas chromatography, and results are benchmarked against occupational exposure limits and ambient air quality guidelines.

What the Client Receives

- Site assessment and identification of appropriate sampling locations.
- Active or passive TVOC sampling using calibrated equipment.
- SANAS-accredited laboratory analysis of collected samples.
- Technical reporting benchmarked against occupational exposure limits and ambient guideline values.
- Recommendations for ventilation, PPE, or process controls where exceedances are identified.

Why It Is Important

- Protects worker health in environments with solvent, fuel, or chemical VOC exposure.
- Supports compliance with the Occupational Health and Safety Act and Hazardous Chemical Agents Regulations.
- Identifies early warning signs of process leaks or ventilation inadequacies.
- Provides defensible, audit-ready records for occupational hygiene compliance.

3. The EPHSA Advantage

- **The End-to-End Solution:** By managing the training, monitoring, physical removal, and legal sign-off — either directly through our own team or through our network of accredited partner companies and laboratories — we provide a single point of accountability for complex environmental projects.
- **Enterprise-Grade Capability:** Our operational frameworks are scaled specifically to meet the rigorous procurement, safety, and reporting standards of parastatals and heavy logistics operators.
- **In-House Technical Authority:** Driven by three specialised partners, our leadership team provides direct oversight on all projects, ensuring unparalleled quality control and risk mitigation.

By partnering with EPHSA, you gain a single, accountable partner for environmental compliance — from baseline monitoring and workforce training through to certified remediation and legal sign-off.
